TABLES

TABLES	DESCRIPTION	PAGE
1	Persons, males and females, at each census from 1851 to 1936 classified according to age groups.	1
2A	Persons, males and females, in certain age groups expressed per 10,000 of the total persons, males and females respectively, at each census from 1851 to 1936 (calculated from Table 1).	2
2B	Persons, males and females, in certain age groups in the province of Leinster expressed per 10,000 of the total persons, males and females respectively, at each census from 1851 to 1936.	3
2C	Persons, males and females, in certain age groups in the province of Munster expressed per 10,000 of the total persons, males and females respectively, at each census from 1851 to 1936.	4
2D	Persons, males and females, in certain age groups in the province of Connacht expressed per 10,000 of the total persons, males and females respectively, at each census from 1851 to 1936.	5
2E	Persons, males and females, in certain age groups in the province of Ulster (part of) expressed per 10,000 of the total persons, males and females respectively, at each census from 1851 to 1936.	6
3	Increase or decrease per cent. in population, according to certain specified age groups, of each province as constituted at each census from 1851 to 1936.	7
4A	Showing for each county and county borough in 1936 the proportion per 10,000 of each sex in each age group with comparative figures for 1926.	8
4B	Showing for aggregate town areas in each county in 1936 the proportion per 10,000 of each sex in each age group.	12
4C	Showing for aggregate rural areas in each county in 1936 the proportion per 10,000 of each sex in each age group.	14
5	Males and females in certain age groups expressed as percentages of the total males and females respectively in each town of 1,500 or more inhabitants and smaller towns possessing local government.	16
6	Males and females in certain age groups expressed as percentages of the total males and females respectively in each rural district (exclusive of towns of 1,500 or more inhabitants and smaller towns possessing local government).	18

TABLES	DESCRIPTION	PAGE
7A	Males 15 years and over at each census from 1871 to 1936 classified according to age groups and conjugal condition—actual numbers and percentages.	22
7B	Females 15 years and over at each census from 1871 to 1936 classified according to age groups and conjugal condition—actual numbers and percentages.	24
8A	Single males and females in each age group expressed as percentages of the total (married, widowed and single) males and females respectively for that age group in each county in each of the years 1891, 1911, 1926 and 1936.	26
8B	Single males and females in each age group in 1936 expressed as percentages of the total (married, widowed and single) males and females respectively for that age group in the aggregate town areas in each county.	32
8C	Single males and females in each age group in 1936 expressed as percentages of the total (married, widowed and single) males and females respectively for that age group in the aggregate rural areas in each county:	34
9	Single males and females in each age group expressed as percentages of total males and females respectively for that age group in each town of 1,500 or more inhabitants and smaller towns possessing local government.	36
10	Single males and females in each age group expressed as percentages of total males and females respectively for that age group in each rural district (excluding towns of 1,500 or more inhabitants and smaller towns possessing local government).	38
11A	Males and females classified by individual ages, orphanhood (under 15 years of age) and conjugal condition (15 years of age and over).	42
11B	Males and females in the aggregate town areas classified by individual ages, orphanhood (under 15 years of age) and conjugal condition (15 years of age and over).	44
11C	Males and Females in the aggregate rural areas classified by individual ages, orphanhood (under 15 years of age) and conjugal condition (15 years of age and over).	46
12	Males and females under 15 years of age in each province, county and county borough and in the aggregate town areas and rural areas of each province and county according to orphanhood condition at each year of age.	48
13	Males and females in each county and county borough according to each year of age from 15 years to 24 years inclusive.	82
14	Males and females in each province in 1936 arranged in quinquennial age groups and classified according to conjugal condition showing also separate particulars for those resident in town and in rural areas.	84
15	Males and females by quinquennial age groups in each county and county borough and in the town areas and rural areas of each county classified according to conjugal condition.	88
16	Number of males and females classified according to age and conjugal condition in each urban and each rural district (including particulars for other towns possessing local government or having 1,500 inhabitants or more).	108
17	Males and females in each superintendent registrar's district classified according to their conjugal condition.	144
18	Males and females in each superintendent registrar's district classified according to quinquennial age groups.	164
19	Males and females in each dispensary (and registrar's) district in each county classified by age groups.	174

TABLES	DESCRIPTION	PAGE
20	International comparison of ages in different countries: numbers in each age group expressed as a percentage of the total.	216
21A	International comparisons of conjugal conditions at each age: single males in each age group expressed as a percentage of the total (married, widowed and single) males in that age group.	217
21B	International comparisons of conjugal conditions at each age: single females in each age group expressed as a percentage of the total (married, widowed and single) females in that age group.	217

CENSUS OF POPULATION, 1936.

VOLUME V PART I.

AGES, ORPHANHOOD AND CONJUGAL CONDITIONS.

CLASSIFIED BY AREAS ONLY.

EXPLANATORY NOTES.

The statistics of the population on 26th April, 1936, classified by ages, orphanhood and conjugal condition, contained in this publication, relate to the area which was formerly comprised in Saorstát Eireann and excludes particulars relating to the Counties of Antrim, Armagh, Down, Fermanagh, Londonderry and Tyrone and the County Boroughs of Belfast and Londonderry. Under the Constitution of 1937 the name of the State is now Eire, or, in the English language, Ireland. The expression " Saorstat Éireann " is, however, being used in all the volumes of the Report of the 1936 Census of Population, as the Census was taken on a date prior to the coming into force of the Constitution Act, 1937.

Although this volume is the second of the 1936 series to be published, it has been given the serial number " V—Part I " of the corresponding subject volume of the previous Census. This procedure is not likely to cause confusion and has been adopted for uniformity and for convenience of reference.

Ages.

The classification of the population by ages is of fundamental importance and the statistics of practically all the attributes of the people which are investigated at the Census require to be classified by ages for their proper interpretation. The present volume deals with the age distribution of the population of different areas of the country. Later volumes will contain particulars of ages of persons cross-classified according to occupations, industries, religions, housing conditions, etc.

At past Censuses, ages were generally not stated with sufficient accuracy. There was a marked tendency to furnish ages ending in the digit 0 and to a lesser extent in 5, and there was also some evidence of a partiality for the units digits 2 and 8. In other countries similar tendencies have been noted.

The Census of 1926 was the first in this country in which householders were requested to state ages in years and months ; in previous Censuses only " age (last birthday) " was asked. At the 1936 Census special care was taken in framing the instructions for filling up the Census Schedule to

indicate that an improvement in the recording of ages was desired and the following special paragraph was inserted in the memorandum of instructions for filling up the Schedules :—

> 'Very particular care should be taken to give the exact age in years and months of each person whose name appears on the Census Form. Persons who have forgotten their correct ages should make reasonable efforts to ascertain them, and not be content to give approximate ages in round numbers, e.g., "40," "50," or "60," when these ages might really be "41 years 2 months," "49 years 9 months," or "62 years 5 months" respectively. The same observation applies to ages in years ending in 5, e.g., 35, 45, 55. Ages in years ending in 0 or 5 should not be given unless it is quite certain that they are correct.'

In addition to this special instruction to householders there was also an instruction issued to the Enumerators who collected the completed Schedules from each dwelling which read :—

> "The age of every person one year old and upwards should be entered in years and months, and those for children less than one year old in months only. At past Censuses statements of age have been very defective, persons at the later ages showing a strong tendency to give ages in round numbers, e.g., 30, 35, 40, 50, 55, 60, 65, etc. On this occasion a marked improvement must be effected. If the Enumerator notices that any of these ages are recorded on the Census Return, he should courteously draw the attention of the head of the household or the person tendering the Form to the Special Instruction on ages and inquire if the age stated is the exact age or only an approximate one. If the person concerned cannot state his or her exact age the Enumerator should inquire about the year of birth and amend the return, if necessary."

The following figures, showing the number of males in 1926 and 1936 respectively at particular ages, indicate that as a result of these special efforts considerable improvement was effected :—

Age.	1926	1936
29	18,001	19,893
30	26,271	22,324
31	14,666	16,598
39	14,550	17,728
40	28,589	22,490
41	11,702	14,699
49	13,838	14,695
50	31,170	21,168
51	11,135	12,650
59	9,641	13,688
60	20,141	18,370
61	6,720	10,987

It will be observed that whereas there was a heavy concentration at the ages 30, 40, 50 and 60 in 1926 as compared with the years immediately preceding and immediately following those years, the figures compiled from the 1936 Census show less numbers at the ages ending in the digit 0 and more at the years before and after. It is accordingly considered that the age distribution of the population as ascertained from the 1936 Census is more accurate than the age distribution as published in the 1926 Census

Report, though there is still considerable room for improvement. It will, of course, be evident that the statistics in the decennial age groups, particularly of the type 25-34, 35-44, etc. (with the age ending in the digit 0 at the centre) are to be regarded as much more reliable than the numbers at individual ages shown in Tables 11A, 11B and 11C. The numbers in the quinquennial age groups 25-29, 35-39, 45-49, etc., may be somewhat understated, and the numbers in the age groups 30-34, 40-44, 50-54, etc., somewhat overstated, in consequence of the concentration at ages 30, 40, 50, etc.

In the few cases in which age particulars were not entered on the Census Schedules, each such case was separately considered and an age based on the other particulars shown on the Schedule was assumed.

Marriage or Orphanhood.

The instruction on the Census Schedule at the head of the column relating to marriage or orphanhood read :—

> 'for persons aged 15 and over information as to whether "single," "married," "widower" or "widow." For children aged under 15 years state in respect of parents, whether both parents alive, father dead, mother dead, or both parents dead.'

The replies in regard to conjugal condition were satisfactory, but in the case of orphanhood condition there were a number of instances in which no information was given opposite the name of the child. Where possible these omissions were rectified from internal evidence but out of a total population of 416,433 males and 403,961 females under 15 years of age, no particulars can be stated in respect of 3,764 males and 3,687 females. In Table 12 the sub-divisions of these numbers by counties are shown in a column headed "not stated."

From the numbers "married," "widowed" and "single" classified by age groups as shown in the tables in this publication further tables were compiled, and are included in this volume, showing the number of "single" persons in each age group expressed as a percentage of the total in that age group. A comparison of such results for this and other countries will be found in Table 21, while an international comparison of ages is contained in Table 20 of this volume.

Particulars of orphanhood conditions for children under 15 years of age which were recorded for the first time in this country at the 1926 Census were again collected and the results are shown in Tables 11A, 11B, 11C, and 12.

Life Table.

A life table based upon the Census population classified by ages and the Registrar-General's statistics of deaths in the years 1935, 1936 and 1937 (and certain other vital statistics) is included as Table 22 in the present volume, together with a memorandum which explains the methods of computation. The algebraical processes used were identical with those used for the corresponding table in the report on the 1926 Census, but, as explained, the abnormal mortality experience in 1937 rendered necessary the use of weighted average mortality rates, instead of simple averages as used in the compilation of the 1925-27 table.

TABLE 1:—TOTAL PERSONS, MALES AND FEMALES IN **SAORSTAT EIREANN** AT EACH OF THE NINE CENSUSES FROM 1851 TO 1936 CLASSIFIED ACCORDING TO AGE GROUPS.

NOTE:—The Military and Navy are not included in the figures in this Table for 1851, but are included for subsequent years.

(a) Age-groups 30-34 and 35-39 are not available for Estonia. The particulars shown are for age-group 30-39. Comparative figures for Saorstat Eireann for this age-group are :—Males 55·8, Females 38·3.

(b) The age-groups are 14-20 years, 21-25, 26-30, 31-35, 36-40, 41-50, 51 years and over.

(c) Includes U.S.S.R. in Asia.

TABLE 22:—LIFE TABLE No. 2, 1935-37—MALES.

(For explanation of calculation *see* Memorandum on p. 222).

KEY TO THE NOTATION.

q_x = the rate of mortality, or the probability of dying in a year. It is the ratio of the number of deaths in the year of age x *to* $x+1$ to the number entering on the year.

p_x = the probability of living a year, or the ratio of the number completing the year of age x to $x+1$ to the number entering on the year.

l_x = the number according to the life table surviving to exact age x.

d_x = the deaths in the year of age x to $x+1$ among lx persons who enter on that year.

L_x = the population according to the life table, or the years of life lived, in the year of age x to $x+1$.

T_x = the population, or the years of life lived, above the moment of age x.

$\mathring{e}_x$ = the complete expectation of life in years, or the total future lifetime which on the average will be passed through by persons aged exactly x.

The following relations hold between these quantities :—

$$p_x = 1 - q_x\ ;\ l_x - l_{x+1} = d_x\ ;\ L_x = \tfrac{1}{2}(l_x + l_{x+1})\ (x > 0)\ ,\ T_x = \sum_{y \geq x} L_y\ ;\ \mathring{e}_x = T_x / l_x.$$

Age. x	l_x	d_x	p_x	q_x	L_x	T_x	$\mathring{e}_x$	Age. x

MEMORANDUM ON THE CONSTRUCTION OF LIFE TABLE No. 2, 1935–37.

Data used in the Construction of the Life Table.

For ages 5 and over the life table data were based on the Census population on 26th April, 1936, and the numbers of deaths in 1935, 1936 and 1937, as recorded in the Annual Reports of the Registrar-General. For the infantile ages the Registrar-General's statistics of births and deaths were used, because in this as in other countries, the numbers of children at ages 0 and 1 are somewhat understated at the Census. The population in each age group was not adjusted to the middle of the Census year, as is usually the practice, because there is no reason to believe that in Ireland the population on 30th June, 1936, would be closer than the population at Census date 26th April, 1936, to the *average* population in the years 1935-37. The grouped population data utilised are given in Table 14 of this Report and the Registrar-General's statistics of births and deaths are appended.

With regard to the mortality data at ages 5 and over, in the ordinary course the simple average number of deaths in each age group in the years 1935, 1936 and 1937 would have been used. It will be evident, however, from the following figures that in the year 1937 mortality was exceptionally high.

Crude Rates of Mortality per 1,000 Population Per Annum.

Year.		*Rate.*	*Year.*		*Rate.*
1925	...	14·6	1932	...	14·6
1926	...	14·0	1933	...	13·7
1927	...	14·8	1934	...	13·2
1928	...	14·2	1935	...	14·0
1929	...	14·6	1936	...	14·4
1930	...	14·2	1937	...	15·3
1931	...	14·6			

The abnormality of mortality in 1937 is thrown into even sharper relief by the quarterly figures: in the first quarter of 1937 the equivalent annual rate was 20·8 compared with 16·7, the average for the five corresponding quarters previous, and 15·6 in the first quarter of 1938. The high mortality in 1937 was in fact due to a severe influenza epidemic.

It is obviously a first essential that the life table should reflect normal mortality conditions at about the time of the Census, so that it could be used with confidence in actuarial computations and for public health purposes during the next few years. It is very difficult, however, to determine what may be regarded as a "normal" mortality experience at any given time. In the present circumstances, there is a strong case for basing the life table on mortality in the single year 1936, but it was considered that the number of deaths recorded in some age-groups was so small as to render likely substantial fortuitous variations in the mortality rates. Eventually it was decided to include the mortality in 1937 in the computation but not to allow it to have its full effect. Instead of weighting mortality equally in the three years 1935, 1936 and 1937, for the actual mortality in 1937 there was substituted in each group a hypothetical figure which represented the simple average in the three years 1935, 1936 and 1937, so that average mortality in each age group for the purpose of Life Table No. 2 is the simple average of the actual mortality in 1935 and 1936, and of this hypothetical figure in 1937. It will be seen that this weighted average is represented by the following formula :—

$$\text{Annual average deaths} = \tfrac{1}{3}\left\{D_{35}+D_{36}+\tfrac{1}{3}(D_{35}+D_{36}+D_{37})\right\} = \tfrac{1}{9}(4D_{35}+4D_{36}+D_{37}).$$

where D_{35} signifies the number of deaths in the age group in 1935, etc. Accordingly, mortality in 1937 has only one-fourth of the "weight" of the mortality in each of the other two years. It is an argument in favour of this somewhat unorthodox procedure that the weighted average mortality as computed by this formula, namely 42,400 (21,908 males and 20,492 females), is very close to the actual mortality in the year 1936, namely 42,586 (21,920 males and 20,666 females), and may be regarded therefore as reflecting mortality conditions in the Census year.

Method of Computation.

The method of computation was identical with that used on the previous occasion, which follows closely on that of Mr. George King* for the construction of English Life Tables Nos. 7 (1901-10) and 8 (1910-12) and adopted with certain modifications by Sir William Watson in the construction of English Life Tables Nos. 9 (1920-22)† and 10 (1930-32).‡

According to this method the life table is based upon the calculation of the functions q_x, the rate of mortality or the probability at exact age x years of dying during the ensuing year. For most ages these functions are based on the life table death-rate m_x, which represents the ratio of the number of deaths at age x (*i.e.*, with average age about $x+\frac{1}{2}$ years) to the population at this age, and which, under general conditions, is related to q_x by the formula :—

$$q_x = \frac{2m_x}{2+m_x}.$$

Mr. King's method involves the computation from the grouped data of "graduated pivotal" values of the populations and of the annual average deaths at certain ages. Mr. King and Sir William Watson used five-year groups for the calculation of pivotal values for most ages. In the construction of the 1925-27 Saorstát Life Table, five-year groups were used from the ages 5–9 to 40–44 (from which the m_x's and accordingly the q_x's from $x=17$ to $x=32$ inclusive were computed) and a partially overlapping ten-year grouping 25–34 to 95–104 (from which the q_x's from $x=40$ to $x=80$ inclusive were found). The broader grouping at the later ages was rendered necessary by the very marked tendency to state ages in numbers ending in the digit 0. The assumption is accordingly implicit in the method that even if the populations at individual ages are not necessarily correct the five-year group totals at the earlier ages and the ten-year group totals at the later ages are dependable. It was recognised that if the five-year group totals could be regarded as correct they should be used throughout. In view of the marked improvement in the statement of ages at the 1936 Census, the desirability of using a five-year grouping at the later ages was carefully considered. It was ultimately decided to adhere to the mixed groups for the following reasons :—

(1) While an improvement has been effected since last Census, Table 11A shows that there is still a marked concentration at ages ending in the digit 0 and accordingly population age groups ending in digits 0–4 must be regarded as overstated and the 5–9 groups as somewhat understated. In this connection the partiality for ages ending in the digit 5 and to a lesser extent in the digits 2 and 8 is very evident.

(2) It cannot be stated definitely (because deaths at ages over 4 are not published by single ages), but it seems very likely, that the concentration on ages ending in the digit 0 would be at least as pronounced in mortality as in population statistics.

(3) Five-year groups for mortality statistics are not available after age 75, and the break-up of the groups 75–84, 85–94 and 95– into five-year groups would involve a substantial element of estimate.

(4) Values of pivotal q_x's based on five-year groups at later ages were computed and found to have lower gradients of increase at certain quinquennial intervals than in the immediate preceding intervals, phenomena for which there appeared to be no biological justification.

From the five-year groups 5–9 to 40–44, graduated pivotal values of the populations and annual average numbers of deaths, and hence the values of q_x, at ages $x=12$, 17, etc., to 37 were calculated, using Mr. King's interpolation formula.§ From the grouping 25–34, 35–44, etc., graduated pivotal values of the population and annual average mortality, and hence q_x, at ages 40, 50, etc., to 90, were computed, using the formula

$$w_{40} = \cdot 1 w_{25-34} + \cdot 105 \triangle w_{25-34} - \cdot 0015 \triangle^2 w_{25-34}.$$

where w_{40} indicates graduated population or deaths at age 40, w_{25-34} the group total and $\triangle w_{25-34}, \triangle^2 w_{25-34}$ the first and second decennial differences. Analogous formulae were used for ages 50, 60, etc.

* Supplement to the 75th Annual Report of the Registrar-General of Births, Deaths and Marriages in England and Wales, Pt. I., Life Tables (Cd. 7512/1914).
† The Registrar-General's Decennial Supplement, England and Wales, 1921. Part I.
‡ The Registrar-General's Decennial Supplement, England and Wales, 1931. Part I.
§ *Op. cit.*, page 49.

The values of q_x from $x=17$ to $x=32$ were calculated by osculatory interpolation from the pivotal q_x's ($x=12$ to $x=37$) [using, with Mr. King,† the function log $(q_x + \cdot 1)$] and from the pivotal q_x's ($x=30$ to $x=90$) the values of q_x by single years from $x=40$ to $x=80$. The values of q_x from $x=33$ to 39 were found by a Lagrangean interpolation from the values of q_{31}, q_{32}, q_{40} and q_{41}.

The values of q_x for ages 0 to 4 were derived solely from deaths in the three years 1935, 1936 and 1937 and from the births registered in each quarter from 1930 to 1937 inclusive, using the formula which Sir Alfred Watson devised for English Life Table No. 9.* It should be observed that the abnormality in the number of deaths in 1937 was confined to the adult ages, so that no modification in the method of calculation of the q_x's at the infantile ages was necessary. Sir Alfred Watson introduced a new formula for the calculation of q_0 in English Life Table No. 10, but this was found to make no appreciable difference in the result as applied to the Irish data and the earlier and simpler formula was retained.

The life table population L_x, or the total number of years of life lived in a year by the l_x, persons who have survived to exact age l_x, is taken as equal to $\frac{1}{2}(l_x + l_{x+1})$ at ages one and over. L_0 represents the sum of l_1 and the number of years of life lived by those who died before reaching age 1, which number is based on the deaths at ages under 1 month, 1–2 months, 2–3 months, 3–6 months and 6–12 months in the years 1935, 1936 and 1937.

From mortality and population data in age groups 2–4, 5–9 and 10–14 years the graduated number of deaths and of population at age 7 (and the value of q_7) were obtained The remaining values of q_x from $x=5$ to $x=16$ were calculated by a Lagrangean interpolation from the known values of q_3, q_4, q_7, q_{12}, q_{17} and q_{18}.

As on the previous occasion, the values of q_x for advanced ages were found from a Makeham graduation (through values of q_x for $x=70$, 80, 90) given by the formula :—

$$\log (1-q_x) = \log s + c^x (c-1) \log a,$$

the constants of which were found to be :—

		Males.	*Females.*
s	=	·9766584	·9770014
a	=	·9996845	·9997362
c	=	1·103847	1·104498

THE ACTUAL-EXPECTED TEST.

In order to show that life tables accurately reflect mortality conditions it is customary to compare in each age group the actual number of deaths with the "expected" number of deaths which represents the group sum product of the Census population and the life table death-rate at each year of life. This test cannot be applied satisfactorily to Irish data on account of the misstatement of ages, particularly the later ages, to which reference has already been made. Such misstatements, resulting in an undue concentration of population at the later ages ending in the digit 0 and to a lesser extent in certain other digits, might result in a marked distortion in the "expected" totals, even if the population age *groups* could be assumed correct. This is due, of course, to the steep gradient of increase in the m_x's within most age groups. In the following table, however, the actual and "expected" numbers of deaths are formally compared, for ages 5 and over.

Ages	Males			Females		
	Actual Deaths 1935–1937 Annual Average	Expected Deaths 1935–1937 Annual Average	Deviation : Expected less Actual	Actual Deaths 1935–1937 Annual Average	Expected Deaths 1935–1937 Annual Average	Deviation : Expected less Actual
5—9 ..	295	297	+ 2	319	317	— 2
10—14 ..	241	239	— 2	254	255	+ 1
15—19 ..	355	361	+ 6	359	352	— 7
20—24 ..	531	524	— 7	507	505	— 2
25—34 ..	899	901	+ 2	979	979	—
35—44 ..	1,113	1,110	— 3	1,099	1,097	— 2
45—54 ..	1,844	1,833	— 11	1,565	1,568	+ 3
55—64 ..	3,408	3,415	+ 7	2,883	2,882	— 1
65—74 ..	5,455	5,317	—138	4,909	4,869	— 40
75—84 ..	3,599	3,534	— 65	3,872	3,759	—113
85—94 ..	881	979	+ 98	1,113	1,205	+ 92
95 and over ..	97	106	+ 9	118	166	+ 48
Total 5 years and over	18,718	18,616	—102	17,977	17,954	— 23

* *Op. cit.*, page 28.
† *Op. cit.*, page 50, *et seq.*

It will be observed that at all age groups up to 55–64 the correspondence is very satisfactory but at the later ages the actual and expected deviate to some extent, as had been anticipated. The discrepancy at ages 85 and over for females is large but compensates for a marked tendency in the other direction at ages 65–84. The aggregate deviation of 102 for males and 23 for females for all ages over 5 may in all the circumstances be regarded as not unsatisfactory.

The possibility of adjusting the rates of mortality in the later age groups so as to bring the expected deaths into closer conformity with actual deaths was considered. It was decided, however, that any empirical alteration of the rates made with a view to bringing together the two series would imply a degree of reliance on the single year populations at the later ages which these data do not warrant.

The Results.

The functions tabulated in the life table are of smooth graduation. The mortality rate qx declines from birth to age 10 for males and 12 for females. Thereafter it increases constantly with age for females but in the case of males there is a slight recession from ages 24 to 26. The mortality rates for females are higher than those of males for ages 7–12 and 16–40 inclusive and at all other ages they are lower. The mortality rates and expectations of life at ages 0, 10, etc., to 80 in 1925-27 and 1935-37 are compared in the following tables :—

RATES OF MORTALITY, q_x

EXPECTATION OF LIFE (YEARS), $\mathring{e}_x$

Age x years	Males		Females	
	Life Table No. 1 1925-27	Life Table No. 2 1935-37	Life Table No. 1 1925-27	Life Table No. 2 1935-37
0	57·37	58·20	57·93	59·62
10	55·20	55·75	54·92	56·10
20	46·40	46·83	46·36	47·26
30	38·39	38·53	38·60	39·22
40	30·43	30·26	30·83	31·18
50	22·67	22·41	23·19	23·28
60	15·75	15·46	16·36	16·17
70	10·02	9·99	10·72	10·59
80	5·81	6·00	6·47	6·46

The marked decline in the mortality rate at the younger ages (except age 0) since 1925–27 will be noted. The increase recorded in q_{70} is a reflection of the substantial increase in the number of deaths registered in the age group 65–74, without a proportionate increase in the corresponding population group, although, as will be seen from Table 1 of this Report, an increase has occurred in this group.

At each year of age up to age 34 for males, and up to age 54 for females, the expectation of life shows an improvement since 1925–27. The increase in the expectation of life at birth was 0·83 years for males and 1·69 years for females. In this, as in most other countries, females have a higher expectation of life at all ages, although the margin in favour of females is unusually low in Ireland at most ages.

DATA USED IN CONSTRUCTION OF LIFE TABLE No. 2.
